

Mid and late-life socioeconomic status and late-life co-morbidity trajectories

Zachary Zimmer (UCSF)
Heidi A. Hanson (University of Utah)
Ken R. Smith (University of Utah)

ACKNOWLEDGEMENTS

NIH: AG022095 “Early Life Conditions, Survival, and Health: A Pedigree-Based Population Study”

NIH: AG036938 “Modeling Disability Trajectories in Rapidly Aging Populations”

Research questions

- * Does one's father's occupation link to own later life health?
- * Does the association remain after adjusting for one's own occupation?
- * Does it remain after adjusting for several other covariates?
- * What do these relationships say about socioeconomic status mobility and later life health?

Background

- * Researchers increasingly asking whether early life conditions impact on later life health (e.g., Bengtsson and Lindstrom 2000; Elo and Preston 1992; Galobardes et al. 2004; Hayward and Gorman 2004; Luo and Waite 2005).
- * Early life SES can relate to many mechanisms such as:
 - nutrition
 - home/neighborhood environment
 - medical care
 - stress
 - educational opportunities
 - in utero
 - development of immunities
 - mortality selection
- * Linking earlier and later life SES speak to issues of mobility on health.

Data: Utah Population Database*

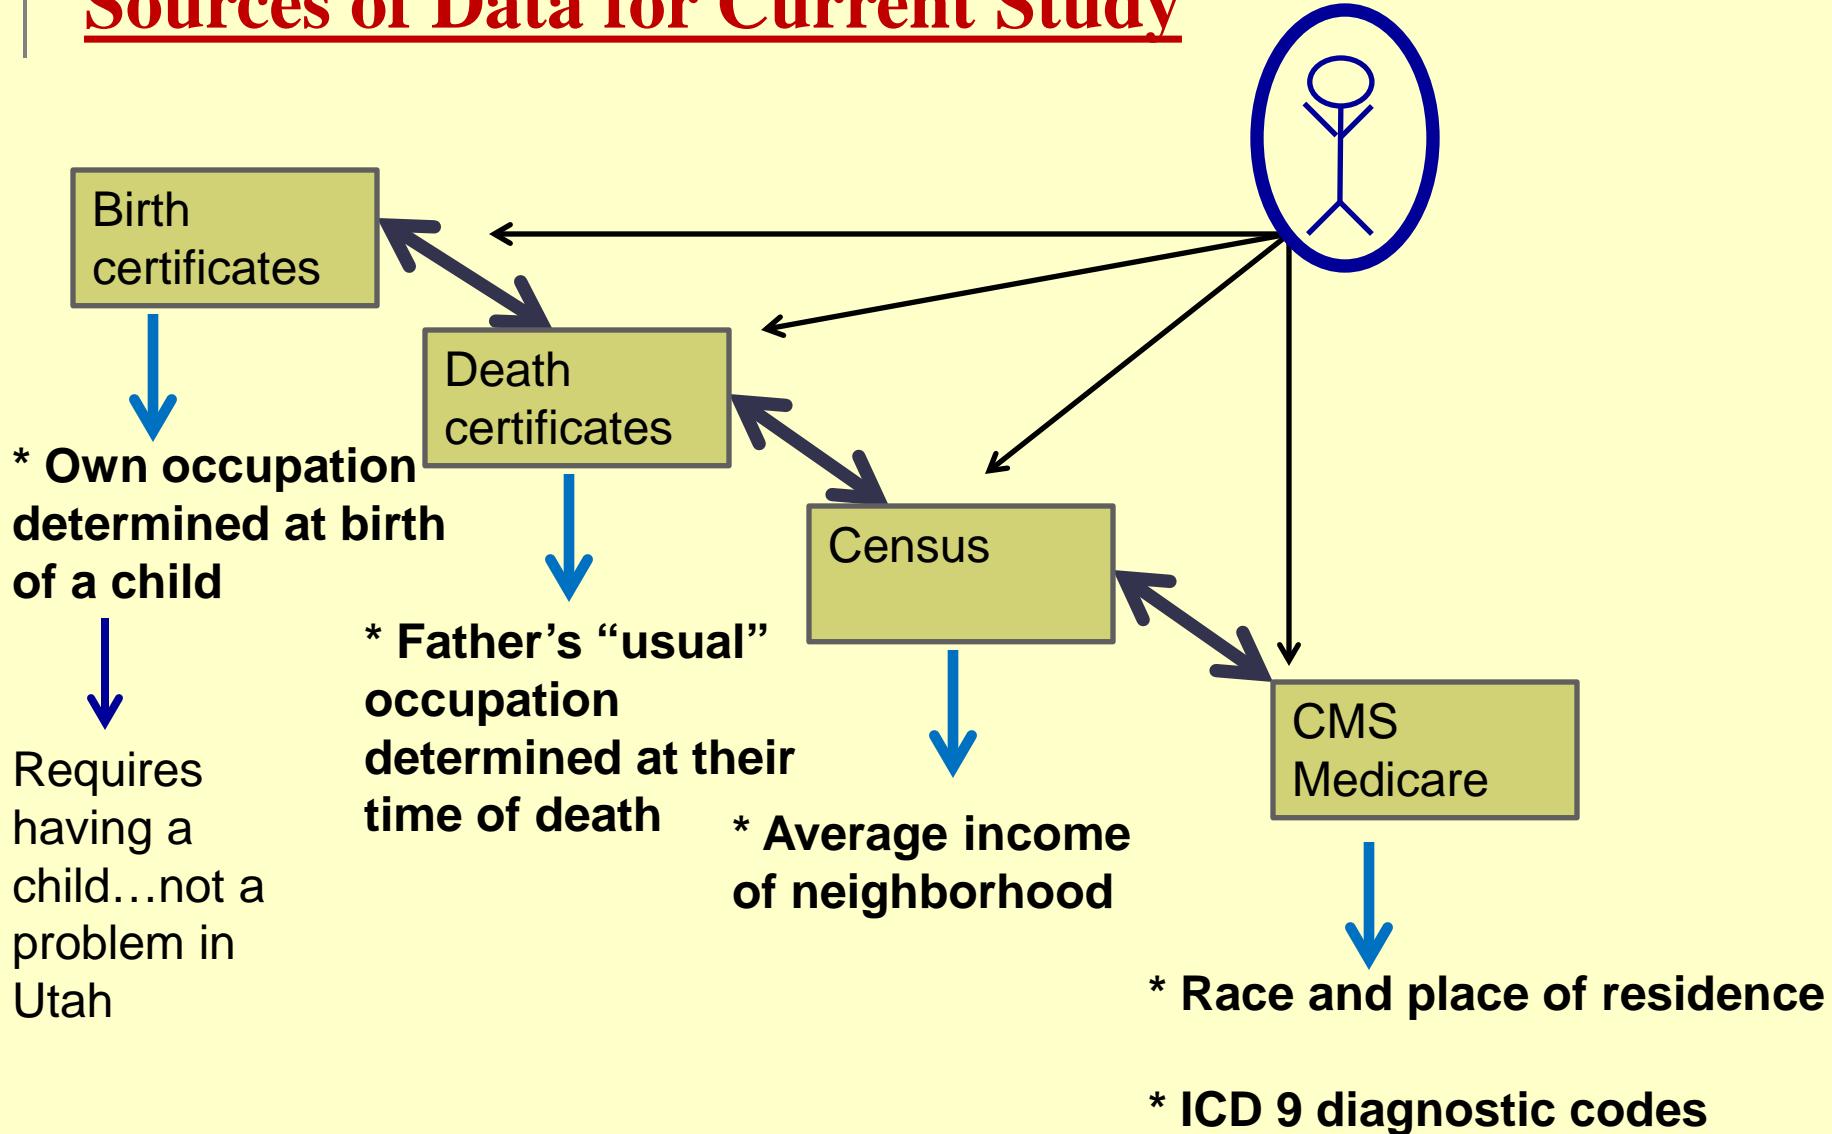

Links individual records from a variety of sources dating back to the early 19th century.

Nearly seven million individuals represented.

* <http://www.huntsmancancer.org/research/shared-resources/utah-population-database/overview>

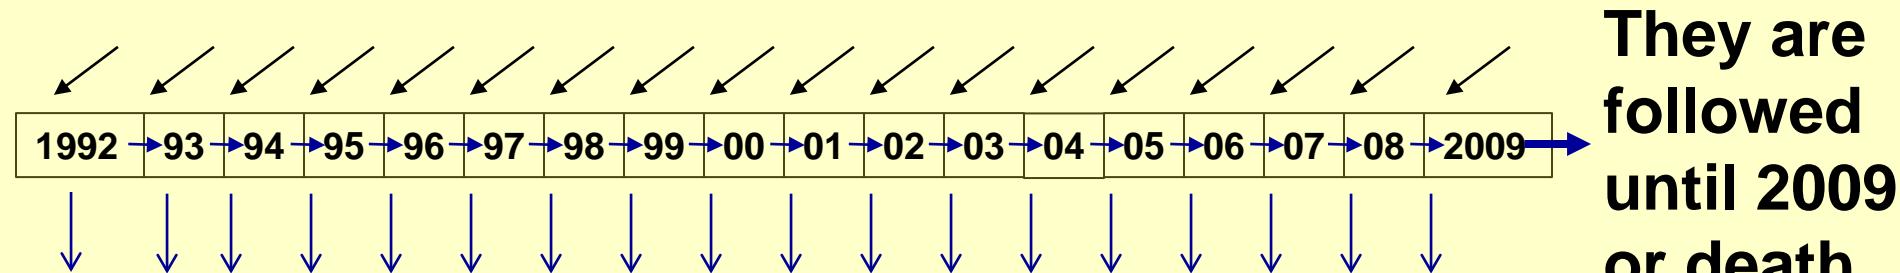

* use of data requires approval – is not downloadable.

Sources of Data for Current Study

Data: 50% sample

40,353 women and 33,392 men enter the data at age 66 at some point between 1992 and 2009.

Recorded each year: having or not having 17 conditions or dying.

In total, there are 668,986 individual years of data collected for 73,745 women and men.

An average of about 9 years of observations per person.

Co-morbidity index

* **Conditions include:**

- | | |
|-----------------------------|----------------|
| Myocardial infarction | Kidney disease |
| Congestive heart failure | Diabetes |
| Peripheral vascular disease | Tumor |
| Stroke | Leukemia |
| Dementia | Lymphoma |
| Chronic lung disease | Liver disease |
| Connective tissue disease | Metastasis |
| Ulcer | AIDS |
| Chronic liver disease | |

* Used to create the Charlson co-morbidity index (Charlson 1987).

Father's and own occupation

Nam-Powers Socioeconomic Scores - 1 to 99 (Nam and Powers 1982)

Grouped into six categories

1st Quintile

2nd Quintile

3rd Quintile

4th Quintile

Farmer (score of 40)

Missing

For own occupation, when married, recorded as highest couple.
If one is not working, occupation of person working is recorded.

Other variables

* Neighborhood SES:

Data from 2000 census based on zip codes recorded from CMS 1992.
Mean income of zip code coded as quartiles.

* Race:

Based on CMS.
White versus Other.

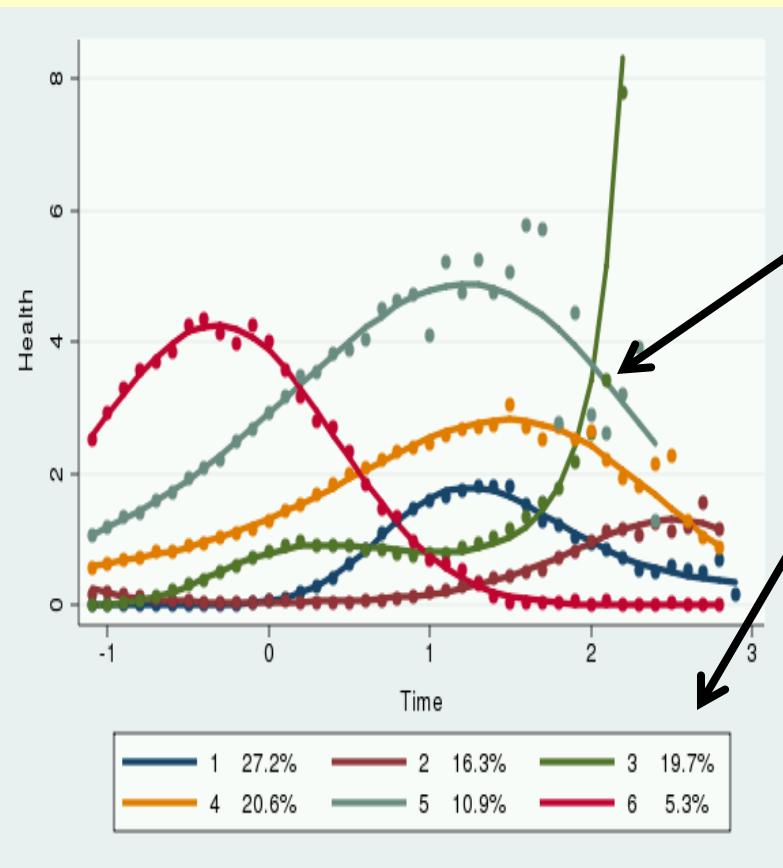

* Residence:

Based on CMS.
Rural / Urban Wasatch front / Urban non-Wasatch front.

Dependent variable: trajectory group

* A health trajectory is a pattern derived from a longitudinal series of scores on some health measure for a single person over time.

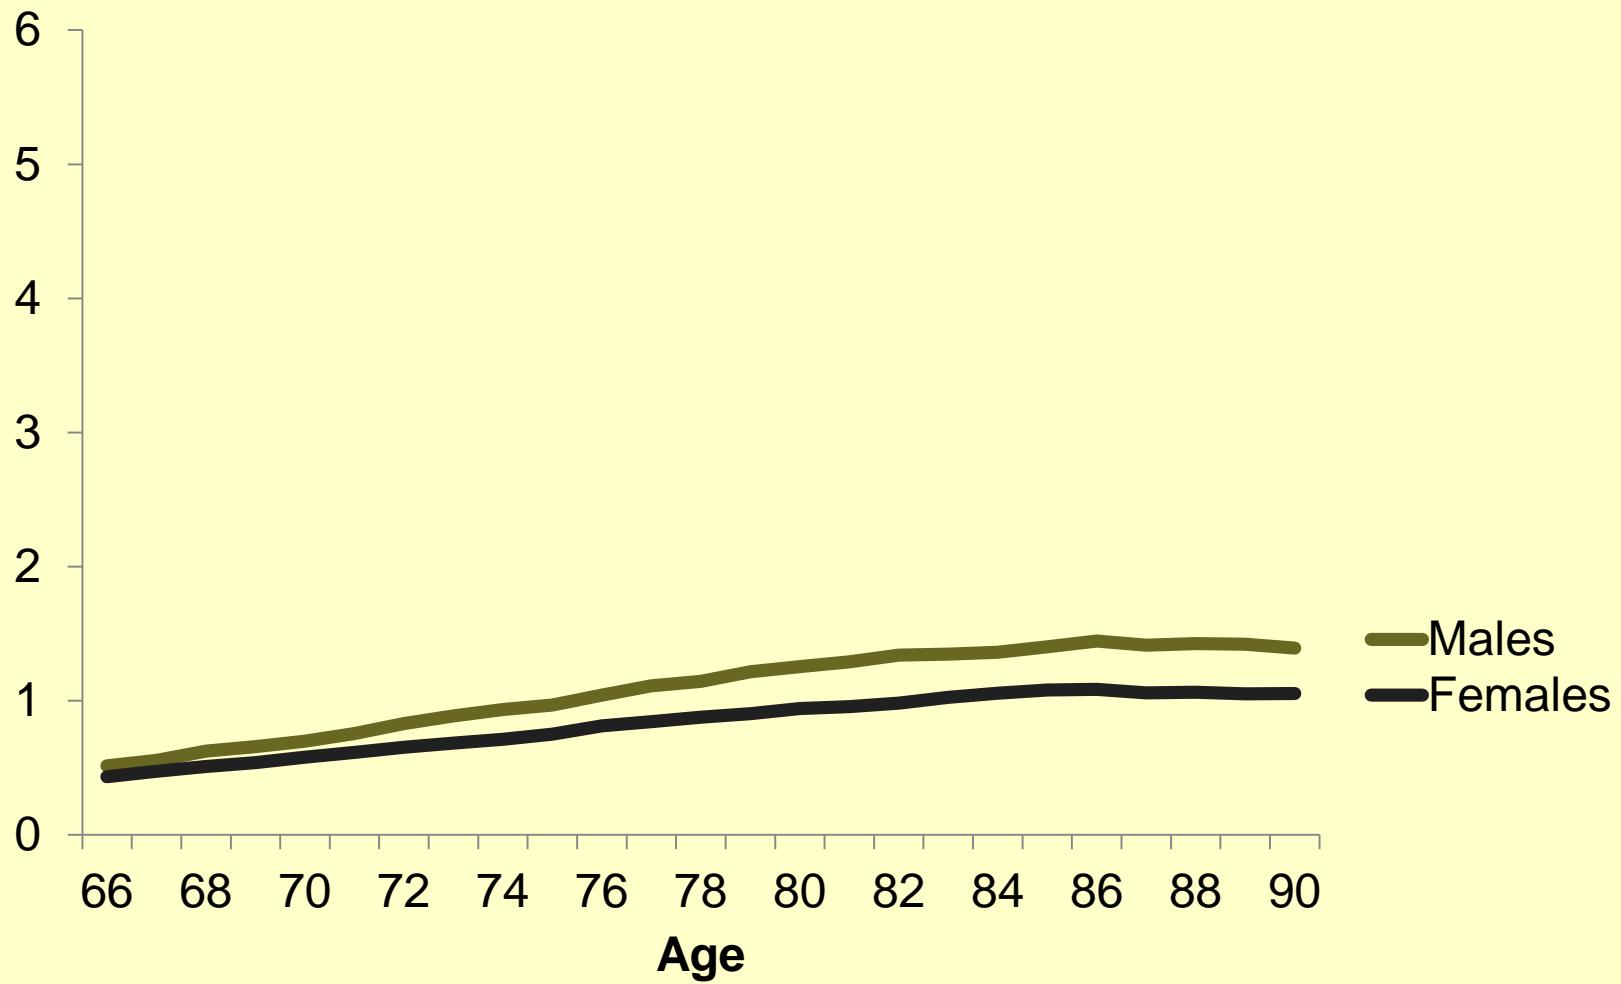

Dependent variable: trajectory group

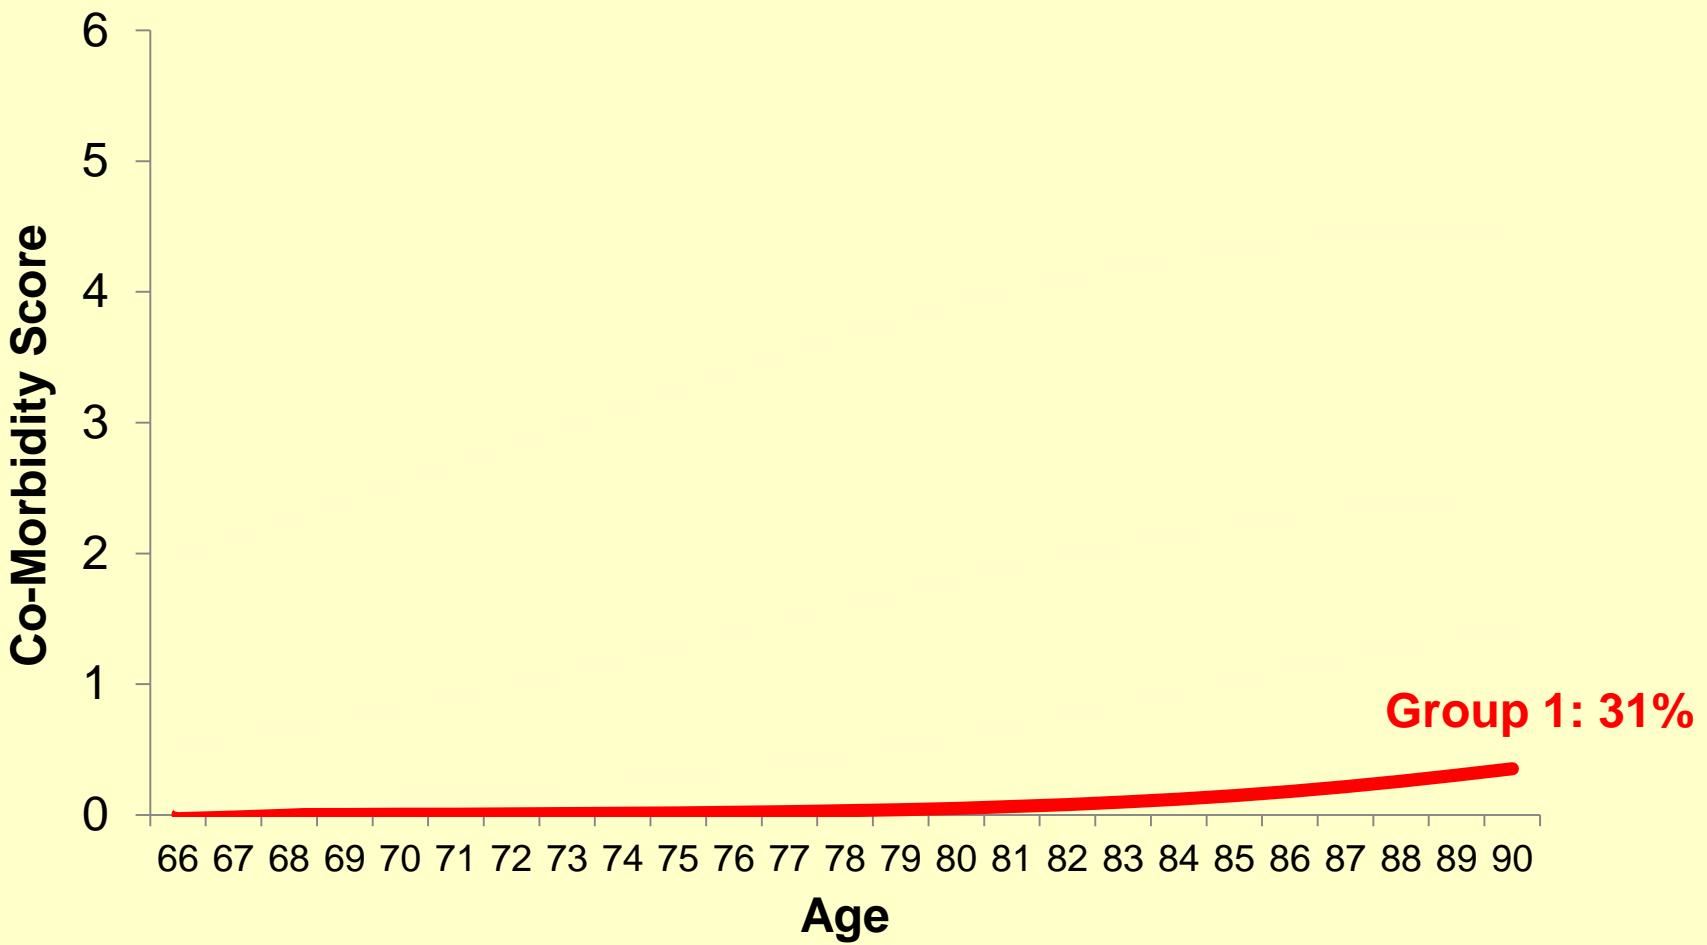

- * A health trajectory is a pattern derived from a longitudinal series of scores on some health measure for a single person over time.
- * Individual trajectories can be sorted into groups that follow statistically similar patterns over time (Nagin 2005).
- * We can estimate percent of a population that follows each trajectory.
- * Shape can take on any form.
- * We can simultaneously estimate mortality trajectories.

* Current study co-morbidity trajectory shapes determined using Zero-Ordered Poisson distribution.

Estimated probability of being in the most and least favorable groups by father's and own occupation

Estimated probability of being in the most and least favorable groups by father's and own occupation

Conclusion

- Both own and father's occupation are predictors of late-life co-morbidity trajectories.
- True of both men and women, but model more robust for women.
- Though you can improve your chances of having better morbidity trajectories by having higher SES, you can never escape the past (i.e., 'the long arm of childhood' (Hayward and Gorman 2004)).
- More research on:
mechanisms
farmers
males vs. females;
- How do trajectories translate into life and active life expectancies?

Thank-you
