## Healthy Aging in Danish Centenarians

## A 29-year follow-up of hospitalizations among 40,000 Danes born in 1905

## THE DANISH AGING RESEARCH CENTER

Kaare Christensen

21st REVES Conference
Copenhagen, May 26-29, 2009

## Background

- Centenarians surpass the current human life expectancy with about 20-25 years.

## Background

- Centenarians surpass the current human life expectancy with about 20-25 years.
- Have centenarians been blessed with a healthier life than contemporaries who died at much younger ages?

## Background

- Centenarians surpass the current human life expectancy with about 20-25 years.
- Have centenarians been blessed with a healthier life than contemporaries who died at much younger ages?
- Centenarians may have reached very advanced age due to a unique capability to postpone disease and disability into their later years of life.

## Aim

## Are centenarians a good model for healthy aging?

Age: 115 years
August 16, 1882*
April 25, $1998{ }^{\dagger}$

Chris Mortensen

## Studying healthy aging in centenarians:

- Control group? Centenarians should be compared with members of their own birth cohort.
- Design? Longitudinal design with prospectively collected information about relevant markers of health.
- Population? A well defined study population with careful ascertainment of each participant to minimize the risk of selection bias.

## Methods

- The Danish Civil Registration System (CRS).
- The unique civil person registration number (CPR number).
- The CPR number serves as the key in all Danish registers and insures accurate linkage between different registers.
- The Danish National Patient Registry (LPR) was established in 1977. Since then, all hospital admissions have been recorded and linked to each individuals CPR number.

## Study population

## 40,355 persons

On January 1, 1977, a total of 40,355 persons born in 1905 were still alive and living in Denmark (aged 72-73 years).

A total of 410 persons were excluded from the study population due to migration.

## 22,264 women

17,681 men

The study population consisted of $\mathbf{3 9 , 9 4 5}$ individuals.

## 39,945 persons

- Hospitalizations
- Number of hospital days

## January 1, 1977 <br> December 31, 2004

Date at death was available until December 2006.

Proportion of non-hospitalized individuals (\%) by age period and age at death in the 1905 Cohort*
